EDUCATION

New York University, Leonard N. Stern School of Business

B.S. in Statistics and Data Science; minors in Mathematics and Computer Science

GPA: 3.7/4.0 | Coursework: Computer Programming, Regression and Multivariate Data Analysis, Decision Making Analytics

Activities: Product Management Club Mentor, BAC Machine Learning Researcher, Management Behavioral Research, Stern Cohort Leader

New York, NY

Expected May 2028

PROFESSIONAL EXPERIENCE

Ditto AI

Product Manager Intern

New York, NY

Jun 2026 - Present

- Analyzed funnel data for 12,000 sign-ups and interviewed 12 users across four onboarding segments; partnered with design and engineering to cut six low-value questionnaire prompts, after which completion rose 11 percentage points in the first rollout cohort.
- Designed a pair-level A/B test for 1,000 eligible pairs to assess a revised post-match flow; the test arm showed an early, directional five-point advantage in completed-date conversion, with cancellations and no-shows tracked as rollout guardrails throughout the trial.
- Used Cox survival analysis to handle right censoring for 7,500 users, including those without a completed date by day 30; linked limited availability with longer waits and scoped an onboarding test prompting users to add more available times before matching.

Simeio

Product Analyst

New York, NY

Jun 2025 - Aug 2025

- Queried 620 application-onboarding requests in SQL and found unowned cases clustered in the longest delays; proposed an owner-assignment pilot with explicit escalation when no owner was available and visible status for requestors and the service team.
- Drafted a PRD and 11 acceptance criteria with design and engineering for the owner-assignment pilot, defining assignment precedence, permissions, source-of-truth fields, audit history, and error states for duplicate or ownerless requests in the intake queue.
- Compared 120 requests before and during an owner-assignment pilot: 48-hour owner confirmation rose from 52% to 74%; segmented failure cases by request type and recommended a staged rollout with monitoring for unassigned tickets and escalation delays.

PROJECTS

JobOS

Sep 2026 - Present

- Built a review-first application manager for students who lost track of ATS submissions and follow-ups; in a guided test, eight students imported 84 historical applications, surfaced 11 overdue follow-ups, and prioritized a queue for overdue and pending cases.
- Designed a Next.js/TypeScript app backed by Neon PostgreSQL, with deduplicated job links, candidate profiles, status transitions, and audit history; stored resumes in Cloudflare R2 with hash checks and linked each version to its application record and submission time.
- Added Playwright-assisted forms with user approval for MFA and submission; routed draft answers to LLMs by task complexity.

Memory Garden

Feb 2026 - Present

- Interviewed 14 college students about why journaling faded; nine said they dropped text-only entries within a week, prompting a low-friction first-entry flow and a visual progress loop that avoids daily streak pressure and encourages revisiting past entries.
- Built a 3D journaling garden in JavaScript and Three.js; mood sets plant color, word count sets growth stage, and tags select species, with custom low-poly plant models, wind animations, responsive lighting, and an interactive garden map for revisiting past entries.
- Reached 300 sign-ups in the initial launch; 29% of users with a full four weeks since their first entry wrote again in their fourth week.

COMPETITIONS

NYU Product Management Club - Salesforce Case Competition

1st place | Apr 2026

- Led a four-person team to prototype Decision Vault, an Agentforce governance layer that scores risky actions, routes high-risk decisions to human approval, and preserves source-linked logs and audit exports; presented MVP scope and a demo to judges.

Ditto AI - Product Case Competition

1st place | Apr 2026

- Led product strategy for Drop Filler, a five-day post-match SMS concept intended to build anticipation before the first date; specified activation and first-date conversion KPIs and an A/B plan for timing, reveal formats, reply prompts, and compatibility reveals.

NYU Product Management Club - Intercollegiate PM Competition

2nd place | Oct 2025

- Prototyped Awareness Mode with motion and Screen Time cues; used 20 interviews and a weighted scorecard to select six features.

EXTRACURRICULAR ACTIVITIES

Business Analytics Club

Machine Learning Researcher

New York, NY

Sep 2025 - Present

- Trained a three-class LightGBM classifier on the public 5,971-message Mishra-Soni SMS dataset, using 15 engineered text features and a deduplicated held-out test set; at the default class decision, the model recalled 88% of phishing messages before tuning.
- Classified 1,090 user-reported scams into 10 types using logistic regression on MiniLM sentence embeddings, then built a FAISS retrieval pipeline to ground each explanation in relevant FTC guidance and cite retrieved passages for each flagged text in the app.
- Set a separate "any scam" alert threshold on validation data: held-out recall was 95% for spam/phishing combined at a 4% false-alert rate on legitimate texts; reviewed errors with SHAP and tested a Gradio demo on 40 club texts before revising warning copy.

SKILLS

Skills: User Research, Product Requirements, Cross-Functional Collaboration, Experimentation, Product Iteration, Business Modeling

Technical: Python, SQL, Tableau, Power BI, JavaScript/TypeScript, PostgreSQL, Next.js, Playwright, A/B Testing, Evaluation Design

AI: Prompt Engineering, Retrieval-Augmented Generation, Tool Calling, Agent Frameworks, LightGBM, FAISS, Gradio, SHAP
